In the command prompt copy and paste the following code: bcrypt.exe /import PublicKey.bkp (You can use any version of bcrypt that you want) Q: OSX Dev - So few.app extensions I have a problem where applications seem to have only very few variations on their name - The Aperture app, for example, has the com.apple.app-preload-data.camera.Apple Aperture 2015 - com.apple.app-preload-data.camera.Apple Aperture 2016 - at the end of their filename. As far as I can tell there isn't an Aperture 2015 app for download and I haven't seen this with other apps in my list. Is there any way to see which apps have more than the most basic extension? I can download and review apps from the Mac App Store, but I don't want to have to do that every time I want to find out which apps have different filenames. EDIT: Based on Tim's answer I tried the following command: find. -type f -name '*AppName*' Unfortunately I got a lot of false positives. When using find. -type f -name 'Aperture*' I get a lot of hits, but they don't appear to be matching the Mac App Store. A: There is a command line tool called apptweak that will list the different application names for you. It's not in any of the standard places so you'll need to download it from the developer's website. Since this seems like a scriptable solution to me, here's a bash script that will find all of the applications, determine which app is the oldest version, and then list it. I had to use the find utility because I couldn't figure out how to do it directly in find. #!/bin/bash # # # Find and list all the applications in the current directory,
