---

I have to create a java project that calculates the age of a person. I used a Java counter to do it but i'm wondering if there is a better way to. The counter ran, but it returns 4 as the answer. Any idea why? I'm wondering if it has anything to do with the BB API. Any help will be greatly appreciated. A: I have to create a java project that calculates the age of a person. I used a Java counter to do it but i'm wondering if there is a better way to. The counter ran, but it returns 4 as the answer. Any idea why? I'm wondering if it has anything to do with the BB API. Any help will be greatly appreciated. I'm assuming you're using a Blackberry simulator. 4 refers to the quarter century, and 4th quarter should be the year of the person's birth. Your code may be running in the 3rd quarter. try this in a simulator:

---

`System.currentTimeMillis()`; This should give you the current time in milliseconds, so you can do some math.

if (`System.currentTimeMillis() - birthDate.getTime() >= (24 * 3600 * 364)`) All that said, this is an old way of getting around the API (BlackBerry has it's own API), and is a known potential source of errors. It makes it hard to get the exact Date object necessary. I think this is what you were trying to do though.

```
int ageInMilliseconds = birthDate.getTime();
int years = ageInMilliseconds / (24 * 3600 * 365);
int years2 = ageInMilliseconds / (24 * 3600) - (1 * 3600);
int months = ageInMilliseconds / (6 * 3600);
int years3 = ageInMilliseconds / (6 * 3600 - 1);
int days = ageInMilliseconds / (24 * 3600 * 24);
```

The problem with your current method is that, since you're using `System.currentTimeMillis()` as the

---

start of your date, the discrepancy with months would become a problem. In years, the months are added to the year, and days to the month of the year. try this instead in your Java code: `Date birthDate = new Date(System.currentTimeMillis()); int years =`
