Technical Noise VST provides a huge set of VST plugins to apply non-linear effects and design the sounds to your preference. You can use it in any program that supports VST plugins. The 25 different sounds include high quality distortions and reverb sounds with a simple interface. To save time in creating the sounds and having a unique style, each of the sounds can be programmed with pre-defined parameters. 25 presets will help you make your sounds. All of the presets are designed with professional results in mind, and are not only for the individual user. Some of the sounds are there just to make your life easier. You can create and create. The setup and creation of the sounds is very easy to use. You can create your own custom sounds that match the effect you want to make by using a couple of buttons.

After the sound is created, you can save it, and use it in your project. You will be surprised by how much realism you can apply using the built-in equalizer, oscillator, and control lines. Hepatocellular carcinoma (HCC) is the third leading cause of cancer-related deaths worldwide (Parkin D. N. et al., Eur J Cancer 2007, 43: 1214-1223). HCC has a poor prognosis and patient survival rate is very low. Because of limited therapeutic options for HCC, these patients often have a poor overall prognosis. It is known that among the most relevant risk factors for HCC is the presence of hepatitis C virus infection (Alimena A. et al., Hepatology 2008, 48: 95-102). However, given that HCC is a cancer affecting the liver, the most frequently affected organ in patients with hepatitis C virus infection, the disease eventually manifests with liver cirrhosis which may be the most important risk factor for development of HCC. In many cases, HCC may

be detected during routine laboratory analysis for an unrelated condition. Therefore, early diagnosis is very important. Since there is no available therapeutic method to prevent progression of HCC in patients with cirrhosis, early diagnosis of HCC could help to improve patient outcome. Serum alpha-fetoprotein (AFP) is a well-known serum tumor marker for HCC and other cancers of the gastrointestinal tract (G. J. W. Schulz et al., *Gastroenterology* 1995, 108: 1436-1443; H. T. Poon et al., *Bi*
