The problem with this situation is that the class I am trying to create an instance of doesn't have an empty constructor. I know that the line of code: instance = new Beep(); is incorrect because the class I am trying to create an instance of doesn't have a default constructor. I want the object to be null in order to check if the constructor was called or not. If I create an empty constructor: public class Beep implements InterfacesBeep{ public Beep() { } } Then the line of code above is correct but then my only option is to create an instance of this class using: Beep beep = new Beep(); Can someone tell me how I can create an instance of this class without the new operator? A: You can use Null Object Pattern: Instead of having many situations where null is a valid answer, you could create a single "null object" and use this all over the place. How? By creating a class called NullObject and making all fields in it null. This pattern is particularly useful when creating API's, as it prevents programmers from using null for objects where a value is expected. You can see the implementation of DefaultNonNull

ShowPassword is a small-sized and portable tool that you can use to reveal passwords hidden behind asterisks, as long as they are saved in the Windows files. It works with programs, email accounts, instant messengers, and other web-related services. As there is no setup pack involved, you can drop the executable file somewhere on the hard disk and run it directly. Alternatively, you can save ShowPassword to a USB flash disk or other removable device, so you can run it on any workstation with minimum effort.
