Advertisement: Well, it's happened. A new study out from the American Enterprise Institute and Cato Institute finds that the "individual market" of health insurance is wildly inefficient and unnecessary, and that it will cost consumers and businesses billions of dollars to eliminate it. Indeed, the study finds that removing the insurance market would lead to a significant increase in the number of uninsured, and the elimination of health care access for millions of Americans: The main reason health insurance is not universally available in the United States today is because the demand for it is not uniformly high. In other words, not everyone wants it. Once you put in place a universally affordable individual insurance market, however, demand will shift, and millions of people will be able to obtain it. Advertisement: "After all, who wouldn't want to have the peace of mind of having a roof over their head when they fall ill?" the report finds, noting that insurance helps people "delay or cut back on consumer spending" and "is the primary determinant of the rate of growth of health spending." The National Center for Policy Analysis and Forbes, which released a report on the same study, agree: At current levels of insurance coverage and health spending, the Affordable Care Act will lead to substantial new health spending and cost increases. However, if more people obtain insurance coverage a1d647c40b
