Office's Memo from minimail was super buggy for me, so I'm deleting the beta and hoping everything gets fixed soon. Overall it wasn't terrible, but it was never really the most consistent app I've used. Its biggest fault was that its design was very reminiscent of the old Contacts app that is not included on Android devices anymore. A lot of the interface design was a homage to the MP3 player era of Android devices. A lot of the features were also fairly old-fashioned: you could mark documents as High Priority, High Priority Marked, and High Priority Marked No Time Frame. "Shapes" are used to sort docs into "dynamic layouts," which is really just a fancy way of saying that the Document is organized into Contacts in one section and a Timeline in another. The only thing that's new is the inclusion of the ability to attach files as contacts. Besides the ugly design, the app's function was fairly good. Templates are included for most of the more common use cases. The app was a lot easier to use than the old Memo app in my experience. The ability to search for documents by mail label was nice. It also had a pretty decent media library. Contacts were always an afterthought in the interface, so many of my contacts were rarely found in that field.
