Lanscan is an essential tool designed for identifying devices on a network and viewing the IP information associated with each detected device. The utility does not interrupt your work and, thanks to its simple design, is suitable for all users. It allows you to choose the IP address range you want to scan and also enables you to change the default IP network mask. Using this tool, you will be able to view the IP address of the detected devices and identify all devices that are available on the network. If you are looking for a network scanner that is easy to use, Lanscan is your perfect companion. The main window of the program is intuitive and simple to use. You can set the IP address range of the network you want to scan and launch the scan. Lanscan does not stop or interrupt your work, as it scans your network while you are running other programs. Lanscan automatically identifies the default IPv4 network of your computer and also recognizes your DNS server address. The utility then scans all hosts in the specified address range. After completion of the scanning process, Lanscan displays a list of detected devices available on your network. Each of the detected devices has its own name, a type of service and an associated IP address, as well as its IP mask. If you set a large IP address range, the scanning process might take a bit too long, however it helps you to produce a simple map of your LAN while it scans the network. During our tests, we found out that the scanning process runs smoothly in the background and does not cause the system to freeze, and neither does it impact other running applications. In case you set a large IP address range, the scanning process might take a bit too long, however it helps you to produce a simple map of your LAN while it scans the network. What's more, the utility helps you to perform reverse DNS lookup of host domain name for each detected IPv4 endpoint. Considering all of the above, Lanscan is a steady solution that helps you to scan your entire network by specifying an IP address range and enables you to generate a network mask for all the detected endpoints that are available in your LAN.
