What Is Adobe Photoshop? Adobe Photoshop is a graphics editing application designed to create digital images from various sources and to edit them. The program was created by Ronald Wayne in 1987 and first released on June 15, 1989, as a suite of separate imaging and graphics editing programs. The first software product to combine these functions into a single package was Apple's MacPaint, released in 1987. It was originally developed for Apple's Lisa computer, and later for the Macintosh. Photoshop was designed to easily handle complex digital images by integrating complex features in one, easy-to-use application. By merging several graphic editing features into one package, Adobe Photoshop provided a simpler application with many complex features. One of the most important features of Photoshop is its Adobe Camera Raw editing system. It is built to enable novice users to easily correct problems and add new effects to captured images. In addition, the program has non-destructive editing features that allow users to correct, change, or add edits to their images without ever having to use Photoshop's irreparable Edit commands. Photoshop is a layered imaging program that allows users to create an unlimited number of digital layers within the same image. By using layers, Photoshop users can easily create visual complexity to an image. It's important to note that Photoshop and other imaging programs do not create layers, but rather images with layers are created in the Photoshop's Viewer or in the external image editing software. There are also a number of other features in Photoshop, including the Blur Gallery, Crop, Change Lens, Clone Stabilizer, Diffuse Glow, Desaturate, Lens Correction, Transform, Warp, and many other features. One of the most important features of Photoshop is its Adobe Camera Raw editing system. It is built to enable novice users to easily correct problems and add new effects to captured images. Features Adobe Photoshop allows you to create and edit digital images by combining the functions of several applications into a single application. Q: How can I execute a stored procedure from Node.js? I have been doing a bit of research for this, and I haven't found anything that is quite relevant. I can call the stored procedure from PHP, using a MySQLi call and this line: $result = mysqli_query($connection, "CALL sp_my_query"); But I can't find anything close to this in Node.js, when it comes to connecting to a MySQL database. It seems pretty obvious that node.js isn't meant to be doing that, but I can't find anything that is similar. Is what I want even possible, or do I have to fall back to some other method? Thanks in advance. A: this should do it: var mysql = require('mysql'); var connection = mysql.createConnection({ host : "localhost", user : "my_user", password : "my_password", database : "my_db", port : 3306 }); connection.query('CALL sp_my_query', [], function(err, rows, fields){ // handle err }); And you'll need to use the mysql driver: var mysql = require('mysql'); If you're using connect-node you could do it like this (although I would use a simple connection object like I showed above that is easier to setup) // connect to MySQL var mysql = require('mysql'); var client = mysql.createConnection({ host: "localhost", user: "my_user", password: "my_password", database: "my_db" }); // execute query client.query('CALL sp_my_query', [], function(err, rows, fields){ // handle err }); A: You can either use node-mysql module, or mysql-native module Once done, just call the SP to execute from your node.js script. A: Try Node MySQL
